The Stellar Dynamo:

Fundamental Properties $\overset{?}{\Rightarrow}$ Long-term Variability

Effective temperature, T_{eff}	median
Radius, R	amplitude
Luminosity, L	flat, cycling (P_{cyc}), erratic
Metallicity, $[\text{Fe}/\text{H}]$	
Rotation Period, P_{rot}	

The S-index of Activity

$$S = \alpha \frac{\mathcal{F}_H + \mathcal{F}_K}{\mathcal{F}_V + \mathcal{F}_R}$$

Calibration Factor (2.3) →

← Due to non-thermal chromospheric heating, proportional to surface fields

← Reference Bandpass

Activity, Amplitude, and Rotation

Can this scatter be consistently explained?

Stellar Twin Search

Euclidean Distance:

$$\begin{aligned}d(\mathbf{p}, \mathbf{q}) &= d(\mathbf{q}, \mathbf{p}) = \sqrt{(q_1 - p_1)^2 + (q_2 - p_2)^2 + \cdots + (q_n - p_n)^2} \\&= \sqrt{\sum_{i=1}^n (q_i - p_i)^2}.\end{aligned}$$

Parameter Vector is $(T_{\text{eff}}, R, P_{\text{rot}})$.

All expressed in solar units.

Allows us to sort stars by similarity.

T_{eff}, R all within 2%
P_{rot} from 3.5-6 days

16% higher **median** activity
not the fastest rotator

18 Sco: The Solar Twin

T_{eff}	1.00
R	1.02
L	1.03
P_{rot}	22.7
$[\text{Fe}/\text{H}]$	-0.02

$\bar{S}$	0.171
A_{98}	0.042
$\bar{A}_{98,s}$	0.016
P_{var}	14;6.5
Q_{cyc}	44;43

Top 4 Most Similar to the Sun

P_{rot} within 12%, wide range of metallicities, radii

Cycles and “Cycles”

Q_{cyc}	$P_{\text{var},1}$	$P_{\text{var},2}$
> 50 “Excellent”	3	0
40-50 “Good”	5	1
30-40 “Fair”	10	6
20-30 “Poor”	5	3
< 20 “No Cycle”	5	18

Top 4 Cycles

#5 is solar twin 18 Sco.

Cycle Period vs. Rotation

Conclusions

- 50-year stellar activity time series allow the detection of longer-term patterns of variability and further confirmation of flat activity stars.
- Fast rotating stars vary $\sim 2\times$ more in 1 year than the Sun does over its 11-year cycle. There are $\sim$ linear trends in amplitude vs. median activity.
- Very clear, clean cycles like the Sun are the minority in this sample of solar-analogs.
- Sun is still lonely in the P_{cyc} vs. P_{rot} diagram, but longer cycles make the situation even more complicated.

The Solar Dynamo Zoo

poster P11.03

Calibration

$$SSS_i = 0.906 \text{ MWO}_i + 0.023 + \text{correction}_i$$
